Response to the Editor — R2

ORACLE: A Persistent Chemical State for Reproducible Molecular Workflows
Journal of Chemical Theory and Computation
Manuscript ID: ct-2026-01539k.R2

Dear Professor Zheng,

We thank you for the provisional acceptance and have addressed the two formatting requirements specified for this final revision. The responses below concern only the R2 requests.

Response to the Editor

Comment 1 (verbatim).

> Please submit your publication files without any markups. You may include annotated version(s) of your revised publication file(s) with colored text or highlights indicating the revisions that you have made as "Supporting Information for Review Only." There is currently red text in the Manuscript File.

Response. The publication manuscript is supplied as a clean PDF and clean source without colored or highlighted text. Any marked version is supplied separately as Supporting Information for Review Only.

Comment 2 (verbatim).

> The github link in the Data and Software Availability section (https://github.com/yogibubu/ORACLE-manuscript) is currently leading to a "Page Not Found" page. Please correct this as the link must be active and accessible at the time of submission.

Response. We replaced the inactive URL throughout the manuscript and Supporting Information with the active public repository URL `https://github.com/yogibubu/ORACLE-standalone`. The repository is public and accessible at the time of this submission.
